Installation Troubleshooting Tips

1. Create your OS X UniBeast USB or iBoot disc drive as per [Guides](#)
2. Once you have created your bootable installer. You are ready to install your OS X version, Please follow the install procedures to the letter.
3. Select your first boot priority using F12 for Gigabyte motherboards, Or the hotkey for your manufacturers motherboard.
4. If you are having trouble reaching the installer. I suggest using the integrated graphics and add your discrete graphics card later. Use -x (safe mode) or -v (verbose mode [Troubleshooting: Issuing Boot Flags](#)) this should give you some information where the installation is stalling. This enables others to help you.
5. Once OS X says the installation is complete. It Automatically restarts, this is where you select your USB drive for the last time. Once at the Chimera Boot Screen select your new installation, if you had to use boot flags for the installer then you need to use them again. I always find safe mode easier to get to the registration of OS X.

Once you reach the Desktop then see [The Basics](#) to help you.
